N-HETEROCYCLIC DERIVATIVES AS NOS INHIBITORS

This application is a continuation-in-part of application Ser. No. 08/808,975, filed February 19, 1997, which is incorporated herein in full by reference.

5

Field of the Invention

The invention relates to a series of *N*-heterocyclic compounds and derivatives useful as inhibitors of nitric oxide synthase (NOS) and to methods of therapy for various diseases employing those compounds.

10

Background of the Invention

Nitrogen monoxide (NO) has been implicated in a number of diverse physiological processes, including smooth muscle relaxation, platelet inhibition, nerve transmission, immune regulation and penile erection. Nitric oxide is produced under various conditions by virtually all nucleated mammalian cells. A number of pathologies are ascribed to abnormalities in NO production including stroke, insulin dependent diabetes, septic shock-induced hypotension, rheumatoid arthritis and multiple sclerosis. Nitric oxide is synthesized in biological tissues by an enzyme called nitric oxide synthase (NOS) which uses NADPH and molecular oxygen to oxidize L-arginine to citrulline and nitric oxide.

20 Nitric oxide synthase (NOS) exists in at least three isoforms, which fall into two primary categories: constitutive and inducible. Two constitutive isoforms, which are calcium and calmodulin dependent, have been identified, and one inducible isoform has been identified. The constitutive isoforms are (1) a neuronal isoform, NOS-1 or nNOS, which is found in the brain and skeletal muscles and (2) an endothelial isoform, NOS-3 or eNOS, which is expressed 25 in the endothelium of blood vessels, the epithelium of the bronchial tree and in the brain. These constitutive isoforms are not the target of the NOS inhibitors of the present invention.

30 The inducible isoform (NOS2 or iNOS) is expressed in virtually all nucleated mammalian cells following exposure to inflammatory cytokines or lipopolysaccharide. Its presence in macrophages and lung epithelial cells is particularly noteworthy. The inducible isoform is neither stimulated by calcium nor blocked by calmodulin antagonists. It contains several tightly bound co-factors, including FMN, FAD and tetrahydrobiopterin.

Nitric oxide generated by the inducible form of NOS has been implicated in the pathogenesis of inflammatory diseases. In experimental animals, hypotension induced by lipopolysaccharide or tumor necrosis factor α can be reversed by NOS inhibitors. Conditions

- 2 -

which lead to cytokine-induced hypotension include septic shock, hemodialysis and interleukin therapy in cancer patients. It is expected that an iNOS inhibitor would be effective in treating cytokine-induced hypotension. In addition, recent studies have suggested a role for NO in the pathogenesis of inflammation, and NOS inhibitors would therefore have beneficial effects on
5 inflammatory bowel disease, cerebral ischemia and arthritis. Inhibitors of NOS may also be useful in treating adult respiratory distress syndrome (ARDS) and myocarditis, and they may be useful as adjuvants to short term immunosuppression in transplant therapy.

The diversity and ubiquity of NO function in physiology make the specific therapeutic targeting of NO-related phenomena an important consideration. Since endogenous NO
10 production is the result of the actions of related but distinct isozymes, the differential inhibition of NOS isozymes allows more selective therapy with fewer side effects.

Testing of the Compounds of the Invention

Nitric oxide synthases are complex enzymes that catalyze the conversion of L-arginine 10 to nitric oxide (NO) and citrulline. Catalysis proceeds through two successive oxidations of the guanidinium group of L-arginine.

A cell-based nitric oxide synthase assay employing the measurement of nitric oxide oxidation product, nitrite, in the conditioned medium of cultured cells was employed for the evaluation of the compounds of the invention. The murine monocytic cell lines RAW 264.7 and 15 J774 are well documented as capable of producing >10 µM nitrite in response to immunostimulation:

Induction of iNOS in RAW 264.7 Mouse Monocytes

RAW 264.7 murine macrophage cells were obtained from American Type Culture Collection (Rockville, Maryland) and were maintained in RPMI 1640 containing 10% fetal bovine 20 serum (FBS), 5000 units/mL of penicillin and streptomycin, and 2mM glutamine (maintenance medium). NOS activity was measured by a fluorescent assay of the nitric oxide oxidation product, nitrite, (Diamanti *et al.*, *Talanta* (1986), Vol. 33, pp. 649-652). Induction of iNOS (inducible nitric oxide synthase) is stimulated by treatment of the cells with lipopolysaccharide and γ-interferon. The method of the assay is described below.

25 Cells are harvested, diluted to 500,000 cells/mL with maintenance medium, and seeded into 96-well plates at 100 µl/well. The plates are incubated overnight at 37°C, under a 5% CO₂ atmosphere. The medium is then replaced with 90 µl of BME medium containing 10% FBS, 100 units/mL of penicillin, 100 µl streptomycin, 2 mM glutamine, 100 units/mL of interferon-γ and 2 µg/mL of lipopoly-saccharide. N-guanidino-methyl-L-arginine is added to four wells 30 (negative control) at a final concentration of 200 µM using 10 µl of 2 mM stock solution in 100 mM Hepes, pH 7.3 + 0.1% DMSO and four wells receive only the 100 mM Hepes/0.1% DMSO buffer (positive control). Compounds for evaluation are dissolved at 10-fold the desired final concentration in Hepes/DMSO and 10 µL of these solutions is transferred to the 96-well plate. The plates are incubated for 17 hrs at 37°C, under a 5% CO₂ atmosphere. Nitrite

- 50 -

accumulated in the culture medium is determined as follows: add 15 μ L of 2,3-diaminonaphthalene (10 μ g/mL in 0.75 M HCl) to each well and incubate for 10 minutes at room temperature. Add 15 μ L of 1 N NaOH and measure the fluorescence emission at 405 nm, using an excitation wavelength of 365 nm. Enzyme activity in experimental wells is normalized

- 5 to percent control using the positive and negative control values. The signal to noise ratio is >10 for the assay.

The compounds of the invention, when tested in this assay, demonstrated the ability to inhibit nitric oxide production.

- 10 Various *in vivo* assays may be employed to determine the efficacy of the compounds of the invention in treating a condition resulting from an abnormality in nitric oxide production, such as arthritis. The following is a description of such an assay utilizing rats:

Effects of Compounds of the Invention on Adjuvant-Induced Arthritis in Rats

15 Male Lewis rats were injected intradermally (proximal quarter of the tail) with 0.1 mL of *Mycobacterium butyricum* in Incomplete Freund's Adjuvant (10 mg/mL). Either vehicle (acidified saline, 1 mL/kg) or a compound of the invention (3, 10, or 30 mg/kg) were administered subcutaneously (b.i.d.), starting on the day following adjuvant immunization, and continued until the end of the experiment (N= 10 rats per treatment group). Clinical scores (see below) were measured in all limbs 3 times per week throughout the study. Rats were euthanized 34-35 days after immunization. At the time of euthanasia, a radiologic evaluation 20 (see below) of the hind paws was performed, a blood sample was collected for clinical blood chemistry and drug levels (high dose group only; 6 or 12 hours post final dose), a section of liver was obtained for measurement of potential toxicity, and the hind limbs were preserved for histopathological determination.

Clinical scoring - each limb was graded according to the following scale:

- | | | |
|----|---|--|
| 25 | 0 | no signs of inflammation |
| | 1 | moderate redness, first indication of swelling, joint flexible |
| | 2 | moderate redness, moderate swelling, joint flexible |
| | 3 | redness, significant swelling and distortion of the paw, joint beginning to fuse |
| 30 | 4 | redness, gross swelling and distortion of the paw, joint completely fused |

- 51 -

Radiological scoring - each hind limb was graded on a scale of 0-3 for each of the following parameters:

- soft tissue swelling
cartilage loss
erosion
heterotrophic ossification

The compounds of the invention, when tested in this assay, demonstrated the ability to treat the arthritis present in the rats.

Those skilled in the art will also recognize that numerous assays for the activity of the NOS isoforms (iNOS, nNOS and eNOS) exist which can be used to evaluate the biological activity of the compounds of the current invention. These include assays for native NOS isoforms in tissues studied *ex vivo* (Mitchell *et al.*, *Br. J. Pharmacol.* (1991), Vol. 104, pp. 289-291; Szabo *et al.*, *Br. J. Pharmacol.* (1993), Vol. 108, pp. 786-792; Joly *et al.*, *Br. J. Pharmacol.* (1995), Vol. 115, pp. 491-497) as well as primary cell cultures and cell lines (Forstermann *et al.*, *Eur. J. Pharmacol.* (1992), Vol. 225, pp. 161-165; Radmoski *et al.*, *Cardiovasc. Res.* (1993), Vol. 27, pp. 1380-1382; Wang *et al.*, *J. Pharmacol. Exp. Ther.* (1994), Vol. 268, pp. 552-557). Those skilled in the art will also recognize that recombinant NOS enzymes can be expressed in heterologous cells by either transient transfection (Karlsen *et al.*, *Diabetes*, (1995), Vol. 44, pp. 753-758), stable transfection (McMillan *et al.*, *Proc. Natl. Acad. Sci.* (1992), Vol. 89, pp. 11141-11145; Sessa *et al.*, *J. Biol. Chem.* (1995), Vol. 270, pp. 17641-17644) or via the use of lytic virus transfection (Busconi & Michel, *Mol. Pharmacol.* (1995), Vol. 47, pp. 655-659; List *et al.*, *Biochem. J.* (1996), Vol. 315, pp. 57-63) using NOS cDNAs. Heterologous expression can be achieved in mammalian cells (McMillan *et al.*, *Proc. Natl. Acad. Sci.* (1992), Vol. 89, pp. 11141-11145), insect cells (Busconi & Michel, *Mol. Pharmacol.* (1995), Vol. 47, pp. 655-659; List *et al.*, *Biochem. J.* (1996), Vol. 315, pp. 57-63), yeast (Sari *et al.*, *Biochemistry* (1996), Vol. 35, pp. 7204-7213) or bacteria (Roman *et al.*, *Proc. Natl. Acad. Sci.* (1995), Vol. 92, pp. 8428-8432; Martasek *et al.*, *Biochem. Biophys. Res. Commun.* (1996), Vol. 219, pp. 359-365). Any of these heterologous expression systems can be used to establish iNOS, nNOS and eNOS assay systems to evaluate the biological activity of the compounds of the present invention.

Administration of the Compounds of the Invention

Any suitable route of administration may be employed for providing a patient with an effective dosage of compounds of the invention. For example, oral, rectal, parenteral (subcutaneous, intramuscular, intravenous), transdermal, and like forms of administration may

- 52 -

be employed. Dosage forms include tablets, troches, dispersions, suspensions, solutions, capsules, patches, and the like.

The pharmaceutical compositions of the present invention comprise the compounds of the invention as the active ingredient, and may also contain a pharmaceutically acceptable carrier, and optionally, other therapeutic ingredients. Carriers such as starches, sugars, and microcrystalline cellulose, diluents, granulating agents, lubricants, binders, disintegrating agents, and the like are suitable in the case of oral solid preparations (such as powders, capsules, and tablets), and oral solid preparations are preferred over the oral liquid preparations. Methods for their preparation are well known in the art.

Because of their ease of administration, tablets and capsules represent the most advantageous oral dosage unit forms, in which case solid pharmaceutical carriers are employed. If desired, tablets may be coated by standard aqueous or nonaqueous techniques. In addition to the common dosage forms set out above, the compounds of the present invention may also be administered by controlled or sustained release means and delivery devices.

Pharmaceutical compositions of the present invention suitable for oral administration may be presented as discrete units such as capsules, cachets, or tablets, each containing a predetermined amount of the active ingredient, as a powder or granules, or as a solution or a suspension in an aqueous liquid, a non-aqueous liquid, an oil-in-water emulsion, or a water-in-oil liquid emulsion. Such compositions may be prepared by any of the methods of pharmacy, but all methods include the step of bringing into association the active ingredient with the carrier which constitutes one or more necessary ingredients. In general, the compositions are prepared by uniformly and intimately admixing the active ingredient with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product into the desired presentation.

Preparation of the Compounds of the Invention

The compounds of the invention may be synthesized by two general approaches, one of which (solid phase) could be thought of as a variant of the other (solution phase). The solution phase generic synthesis is shown in the following Reaction Scheme 1 which, for illustration purposes only, illustrates the synthesis of a compound of formula (I) where A is $-C(O)N(R^1)R^2$. It is understood that other compounds of the invention may be prepared in a similar manner. In the following Reaction Scheme 1, PG is a suitable protecting group; m, n, q, r, Q, U, W, X, Y and Z are as described above in the Summary of the Invention; V is $N(R^4)$, S or O (where R^4 is as described in the Summary of the Invention); and $R^1, R^2, R^3, R^{12}, R^{13}, R^{14}, R^{15}, R^{17}$, and R^{20} are as described above in the Summary of the Invention:

- 67 -

Reaction Sch m 1

- 68 -

In general, the compounds of formula (I) are prepared by first adding one equivalent of a compound of formula (XI) in one portion to a solution of one equivalent of a compound of formula (XII) having at least two substituents displaceable by a nucleophile and 1.1 equivalents of a trialkyl amine base (such as triethylamine) in a polar, nonprotic solvent such as THF or
5 methylene chloride to provide the compound of formula (XIII). Upon completion of the reaction, the mixture is purified by conventional methods.

The compounds of formula (XIVcc) are synthesized by methods well known in the amino acid and peptide synthetic art from the appropriate compound of formula (XIVaa), wherein PG is a standard protecting group for the V substituent. Compounds of formula (XIVaa) are
10 commercially available, usually in protected form, or are readily synthesized by procedures well-known in the art. Preferred protecting groups are Boc (*t*-butoxycarbonyl) and Fmoc (fluorenylmethoxy-carbonyl), although others, such as CBZ (benzyloxycarbonyl), and Troc (trichloroethoxycarbonyl), could be used for particular circumstances. Side chain functionalities may be protected, as is well known in the peptide art, by Trt (triphenylmethyl), tBu (*t*-butyl), Acm
15 (acetamidomethyl) etc. The protected compounds of formula (XIVaa) are reacted with the appropriate amine to produce the compounds of formula (XIVbb) and deprotected to produce the compound of formula (XIVcc), once again by methods well known in the peptide art.

One equivalent of the compound of formula (XIVcc) is added to a solution of one equivalent of the compound of formula (XIII) and one equivalent of base in a polar, aprotic
20 solvent such as THF. The reaction is heated to a temperature at which the reaction proceeds cleanly to completion in less than 16 hours. Upon completion of the reaction, the compound of formula (I) is purified and characterized by conventional methods.

Compounds of formula (I) having the so-called "reverse amide", i.e., where A is -N(R¹)C(O)R² can be made from the appropriate acid of formula (XIVaa) by Hofmann
25 rearrangement of the acid to an amine, followed by acylation with an appropriate acid under the conditions described above. In many cases, the desired diamine can be obtained commercially.

The compounds of formula (I) in which A is a urea may be prepared by reacting a compound of formula (I) where A is -N(R¹)R²¹ (where R¹ is hydrogen and R²¹ is hydrogen, alkyl,
30 aryl or aralkyl) with an isocyanate. Similarly, the compounds of formula (I) in which A is a carbamate may be prepared by reacting a compound of formula (I) (where A is -N(R¹)R²¹ where R¹ is hydrogen and R²¹ is hydrogen, alkyl, aryl or aralkyl) with an alkyl chloroformate or by Curtius rearrangement of the carboxylic acid azide of the compound of formula (XIVaa) in the presence of the appropriate alcohol.

After two minutes, one equivalent of piperonylamine is added and the mixture allowed to warm to room temperature. After thirty minutes, the reaction mixture is passed through a bed of Celite and all
5 volatiles are removed under reduced pressure to yield *N*-Boc-D- β -thienylalanine piperonylamine.

The *N*-Boc-D- β -thienylalanine piperonylamine in methanol is treated with acetyl chloride. After 45 minutes, all volatiles are removed under reduced pressure to yield D- β -thienylalanine piperonylamine hydrochloride.

- 10 One equivalent of imidazole is added in one portion to a solution of one equivalent of trichloropyrimidine and 1.5 equivs of triethylamine in THF. After reaction is complete, the reaction mixture is poured into saturated, aqueous ammonium chloride and extracted three times with ethyl acetate. The combined organic layers are washed with brine and dried. The reaction mixture is filtered and all volatiles removed under reduced pressure. The product,
15 2-imidazolyl-4,6-dichloropyrimidine (the compound of formula (VIIa)) is isolated by flash chromatography (20% ethyl acetate in hexane) as an off-white solid.

Two equivalents of D- β -thienylalanine piperonylamine hydrochloride are added to a solution of one equivalent of 2-imidazolyl-4,6-dichloropyrimidine (the compound of formula (VIIa)) and three equivalents of Hünig's base (diisopropylethylamine) in THF. After reaction is
20 complete, all volatiles are removed and the product (the compound of formula (Iaa)) is isolated.

A specific example of the synthesis as applied to sarcosine piperonyl amide hydrochloride is provided:

- Isobutyl chloroformate (226 μ L, 1.73 mmol) was added to a solution of *N*-Boc sarcosine (1.73 mmol) and *N*-methylmorpholine (192 μ L, 1.73 mmol) in THF. After two minutes,
25 piperonylamine (216 mL, 1.73 mmol) was added and the mixture allowed to warm to room temperature. After thirty minutes, the reaction mixture was passed through a bed of Celite and all volatiles were removed under reduced pressure to yield *N*-Boc sarcosine piperonyl amide (531 mg, 95%) as a white solid. 1 H NMR: (CDCl_3) δ 2.41 (s,3H), 3.28 (s,2H), 4.39 (d,2H), 5.95 (s,2H), 6.80 (m,3H), 7.43 (bs,1H), 9.04 (bs,1H).
30 *N*-Boc sarcosine piperonyl amide (500 mg, 1.54 mmol) in methanol (10 mL) was treated with acetyl chloride (1 mL). After 45 minutes, all volatiles were removed under reduced pressure to yield sarcosine piperonyl amide hydrochloride (395 mg, quant.) as a sticky solid.

Imidazole (9.5 g, 140 mmol) was added in one portion to a solution of trichloropyrimidine (24.7 g, 135 mmol) and triethylamine (30 mL, 216 mmol) in THF (500 mL). After 16 hrs, the

After 16 hrs, all volatiles were removed and the product was 10 isolated as a waxy solid (29 mg, 78%). ¹H NMR (CDCl₃) δ 3.2 (s, 3H), 4.25 (s, 2H), 4.38 (s, 2H), 5.88 (s, 2H), 6.30 (bs, 1H), 6.42 (bs, 2H), 6.65 (m, 3H), 7.05 (s, 1H), 8.40 (s, 1H).

Another specific example of the synthesis of a compound of (XIc) is provided:

Boc-pyrrolidine (3.0 g, 17.5 mmol) was dissolved in ether (35 ml) and tetramethylethylenediamine (TMEDA) (2.03 g, 17.5 mmol), cooled to -78 °C and s-butyllithium (1.3 M, 13.5 mL, 18 mmol) was added. After stirring for 1 hour, allyl bromide was added in ether (5 mL). After warming to room temperature, the reaction was quenched with water and the organic layer was separated. The organic layer was washed with 1 M solution of NaH₂PO₄ and water, then dried over MgSO₄. The above synthesis may be carried out as follows: To a solution of LDA (1.28 g, 12 mmol) in THF (30 mL) at -78 °C was added 2,4-dichloro-6-methylpyrimidine (1.96 g, 12 mmol) in THF (15 mL). After stirring for 15 minutes, 3,3-dimethylallyl bromide (1.79 g, 12 mmol) in THF (5 mL) was added dropwise. After the reaction warmed to ambient 5 temperature, water and ethyl acetate was added. The organic layer was separated; the solvent was removed *in vacuo*, and the residue was chromatographed (ethyl acetate/hexane, 1/19) to give 2.06 g (74%) of 2,4-dichloro-6-(4-methyl-3-pentenyl)pyrimidine (^1H NMR (CDCl_3) δ 7.15 (s, 1H), 5.10 (t, 1H), 2.80 (t, 2H), 2.45 (m, 2H), 1.70 (s, 3H), 1.55 (s, 3H)). The solid phase generic synthesis may be conceptualized as the generic synthesis of Reaction Scheme 1 in which R^1 has been replaced by a cleavable attachment to a derivatized polymer resin. At the end of the synthetic scheme, the resin is cleaved and R^1 becomes hydrogen. The solid phase synthetic scheme is illustrated in Reaction Scheme 7 as applied to 25 the specific example, as before, of a piperonylamine, but in this case the amino acid is piperazine-2-acetic acid:

- 84 -

Reaction Scheme 7

- 85 -

Reaction Scheme 7 continued

- 86 -

In the solid phase synthesis, the group which is to become R¹ is attached to the resin through a cleavable linkage, such as the 2-nitrobenzyl residue, which can be photolytically cleaved. In the example shown, the piperonylamine (see above) has been protected with Boc and reacted with 4-(bromomethyl)-3-nitrobenzoic acid to produce the Boc-protected compound 5 of formula (XXI), which is then attached to a free amine of the lysine-derivatized, amino-functionalized synthetic support. In this case, a polyethyleneglycol-grafted crosslinked polystyrene, 1% DVB crosslinked polystyrene or crosslinked polydimethylacrylamide is suspended in a polar aprotic solvent such as methylene chloride, DMF or THF. An excess of the suitably protected linker-synthon is added to the suspended support followed by a coupling 10 reagent such as diisopropylcarbodiimide (DIC), dicyclohexylcarbodiimide (DCC), *bis*(2-oxo-3-oxazolidinyl)phosphinic chloride (BOP), or O-(7-azabenzotriazol-1-yl)-1,1,3,3-tetramethyluronium-hexafluorophosphate (HATU) and optionally an acylation catalyst such as dimethylaminopyridine (DMAP) or hydroxybenzotriazole (HOBT). The mixture is agitated at ambient temperature for 1 to 24 hours or until the reaction is complete as judged by a ninhydrin 15 test. The resin is washed with an appropriate solvent or solvents multiple times to remove excess reagents and by-products to give the resin-compound of formula (XXII).

The resin-compound of formula (XXII) is deprotected to liberate the compound of formula (XXIII), which is then suspended in a polar aprotic solvent such as methylene chloride or DMF. An excess of an appropriately protected compound of formula (XXIV) is added 20 followed by a coupling agent such as HATU, BOP or DIC with the optional addition of an acylation catalyst such as DMAP or HOBT. Alternatively an excess of an activated form of the compound of formula (XXIV), such as the symmetrical anhydride or acyl fluoride may be added to the resin. The mixture is shaken for 1 to 24 hours at ambient temperature and then washed multiple times with an appropriate solvent or solvents to remove excess reagents and by- 25 products to give the resin-compound of formula (XXV).

Resin-compound of formula (XXV) is deprotected to liberate the compound of formula (XXVI), which is then suspended in a polar aprotic solvent such as DMF or THF. An excess of the appropriate compound of formula (VIIib) is added followed by an excess of a base such as triethylamine or diisopropylethylamine. The mixture is agitated and heated to 50-100°C for 1 to 30 24 hours, then cooled and washed multiple times with an appropriate solvent to remove excess reagents and by products to give resin-compound of formula (IXaa). The resin-compound of formula (IXaa) is optionally treated to liberate protected functionality incorporated as part of a synthon to produce the compound of formula (iii).

For those compounds in which the substitution pattern of the piperazine is reversed

(e.g., examples 95-102 below), the procedure of the preceding paragraph may be slightly modified. Resin-compound of formula (XXV) is deprotected with piperidine to liberate an amine and then dissolved or suspended in an inert solvent, such as methylene dichloride. An excess of an appropriately protected acid that will furnish R⁶ is added followed by a coupling agent 5 such as HATU, BOP or DIC with the optional addition of an acylation catalyst such as DMAP or HOBT. Alternatively an excess of an activated form of the acid, such as the symmetrical anhydride or acyl fluoride may be added to the resin. The mixture is shaken for 1 to 24 hours at ambient temperature and then washed multiple times with an appropriate solvent or solvents to remove excess reagents. The product is suspended in a polar aprotic solvent, such as DMF or 10 THF. An excess of the appropriate compound of formula (VIIib) is added followed by an excess of a base such as triethylamine or diisopropylethyl-amine. The mixture is agitated and heated to 50-100°C for 1 to 24 hours, then cooled and washed multiple times with an appropriate solvent to remove excess reagents and by products to give resin compounds analogous to the resin-compound of formula (IXaa), but having the pyrimidine attached to the piperazineacetic 15 acid at the 4-position.

This resin compound analogus to the resin-compound of formula (IXaa) is then suspended in a protic solvent such as methanol or acetonitrile-water and stirred and photolyzed to cleave the product from the resin. Filtration, and evaporation of the filtrate gives the crude product, which is then purified and characterized by standard techniques.

20 In a specific example, 1.57 g of an amino-functionalized TentaGel resin (0.80 mmole) was suspended in 20 mL of methylene chloride and treated with 1.05 g of linker acid (2.4 mmole), 0.50 mL of DIC (3.2 mmole), and 20 mg of DMAP (0.16 mmole). The mixture was shaken at room temperature for 20 hours and then washed with methylene chloride ten times to give a resin-compound of formula (XXII). The resin-compound of formula (XXII) was treated 25 with 50% trifluoroacetic acid (TFA) in methylene chloride at room temperature for 2 hours and then washed with methylene chloride ten times, 15% triethylamine in methylene chloride for 10 minutes, and again methylene chloride for 5 times. The deprotected resin-compound of formula (XXIII) was then suspended in 12 mL of methylene chloride and treated with 1.444 g of the compound of of formula (XXIV) (3.2 mmole), 1.216 g of HATU (3.2 mmole), and 1.3 mL of 30 diisopropylethylamine (7.2 mmole). The mixture was shaken for 16 hours at ambient temperature and then washed 5 times to give resin-compound of formula (XXV). The Fmoc was removed by treatment with 30% piperidine in DMF and 777 mg of the resulting resin-bound compound of formula (XXVI) (0.35 mmole) was then reacted with 320 mg of 2-imidazolyl-4-chloropyrimidine (the compound of formula (VIIib)), in the presence of 0.61 mL of

diisopropylethylamine (3.5 mmole) in 12 mL of DMF at 80°C for 15 hours and then cooled to room temperature and washed with DMF and methylene chloride to give the resin-compound of formula (IXaa). The final product was cleaved from the resin by photolysis in methanol (MeOH) for 17 hours to give 54.6 mg of product, a compound of formula (iii) (31%). The crude product
5 was purified by flash chromatography (eluted with 4:4:1 ethyl acetate:hexanes:MeOH). The Boc-protected amine product was treated with 3 mL of 30% TFA-methylene chloride for 1 hour and was dried *in vacuo* to give quantitative amount of product.

The piperazineacetic acid compound of formula (XXIV) employed in the synthesis above and many others in this application was synthesized as follows: Twelve milliliters (50 mmol) of
10 *N,N'*-dibenzylethylene-diamine, 14 mL (100 mmol) of Et₃N and 250 mL toluene were combined at 0°C, and 7 mL (50 mmol) of methyl 4-bromocrotonate (7 mL, 50 mmol) was added. The reaction was slowly warmed to room temperature, stirred for 24 hours, filtered, concentrated *in vacuo* to a residue and treated with 10% aqueous HCl (300 mL). The mixture was filtered again and the filtrate washed with ethyl acetate (2x100 mL). The filtrate was made basic with K₂CO₃
15 and extracted with ethyl acetate (3x150 mL). The combined extracts were washed with brine, dried over MgSO₄ and concentrated *in vacuo* to give 13.7 g of methyl 1,4-dibenzylpiperazine-2-acetate. ¹H NMR (CDCl₃) δ 2.28-2.50 (m,4H), 2.5-2.75 (m,4H), 3.1 (bs, 1H), 3.42 (d,2H), 3.52 (d,1H), 3.6 (s,3H), 3.75 (d,1H), 7.15-7.35 (m,1H).

The 13.7 g (40 mmol) of methyl 1,4-dibenzylpiperazine-2-acetate, 150 mL of MeOH,
20 50 mL of 1 N HCl (aqueous) and 3 g of 10% Pd/C were combined and hydrogenated with H₂ (50 psi) for 24 hours. The reaction was filtered, the filtrate was concentrated *in vacuo* to remove most of the MeOH, and the residue was made basic with K₂CO₃ to pH = 9-10, and 9.8 g (40 mmol) of BOC-ON was added slowly at 0° C. The reaction was stirred at 0° for 1 hour, allowed to warm up to room temperature, stirred for 2 hours, and extracted with ethyl
25 acetate (2x200 mL). The combined extracts were treated with 50 mL of 10% HCl (aqueous). The aqueous layer was washed with ethyl acetate, basified with K₂CO₃ and extracted three times with ethyl acetate. The combined organic layers were washed with brine, dried over MgSO₄ and concentrated *in vacuo* to give 7.89 g of methyl 4-Boc-piperazine-2-acetate;

A portion (5.2 g; 20 mmol) of the methyl 4-Boc-piperazine-2-acetate product from the previous step was combined with 60 mL of THF and 60 mL of 1 N NaOH (aqueous) and stirred at room temperature for 6 hours to saponify the methyl ester. The reaction was cooled to 0°C, adjusted to pH 9-10 with 10% HCl(aqueous), and 5.2 g (20 mmol) of FMOC-Cl was added.

- 89 -

The reaction was stirred at room temperature for 6 hours, (adding 1 N NaOH (aqueous) to maintain pH = 9-10) 1 hour, then acidified with 10% HCl to pH = 1. The reaction was extracted twice, the combined organic layers were washed with brine, dried over MgSO₄ and concentrated *in vacuo* to give 8.56 g of the desired 4-Boc-1-Fmoc-piperazine-2-acetic acid (the compound of formula (XXIV)); ¹H NMR (CDCl₃) δ 1.4 (s,9H), 2.5-3.0 (m,5H), 3.9-4.2 (m,6H), 5 4.5 (m,1H), 7-25 (t,4H), 7.32 (t,4H), 7.48 (d,4H), 7.75 (d,4H).

In the cases in which 4-Boc-1-Fmoc-piperazine-2-acetic acid (the compound of formula (XXIV)) was replaced by 4-Boc-1-Fmoc-piperazine-2-carboxylic acid, the starting material was prepared by dissolving 5.25 g (25.85 mmol) of 2-piperazine carboxylic acid·2HCl in 160 mL of 10 1:1 dioxane/H₂O, and adjusting the pH to 11 with 50% NaOH (aq.). A solution of 7.21 g (29.28 mmol) of BOC-ON in 40 mL of dioxane was slowly added (in portions) while maintaining the pH at 11 with 50% NaOH (aq.) during the addition. The reaction was stirred at room temperature for 5 hours, then cooled to 0°C and adjusted to pH 9.5 with 50% NaOH (aq.). A solution of 7.34 g (28.37 mmol) of FMOC-Cl in 40 mL of dioxane was slowly added (in portions), maintaining a 15 pH of 9.5 during the addition with 50% NaOH (aq.). The mixture was warmed to room temperature, stirred for 20 hours, washed with ethyl ether (3x150 mL), adjusted to pH = 2-3 with 6N HCl (aq.), and extracted with toluene (3x150 mL). The combined extracts were dried over Na₂SO₄, concentrated *in vacuo* to a volume of 150 mL and chilled at -20° C overnight. The resulting solids were filtered off, washed with hexane and dried *in vacuo* to give 5.4 g of the 20 desired 4-Boc-1-Fmoc-piperazine-2-carboxylic acid.

Alternatively, 4-Boc-morpholine-3-carboxylic acid, which can be substituted for the compound of formula (XXIV) in Reaction Scheme 7 above to prepare other compounds of the invention, can be prepared in the following manner: To a solution of 4-phenylmethylmorpholin-5-one-3-carboxylic acid methyl ester (5.1 g. 20.5 mmol) in 100 mL of THF was added 25 borane/DMS (10M, 2.6 mL) slowly while cooling at 0°C. The solution was allowed to warm to ambient temperature and stirred for 18 hours. Water (100 mL) was then added and the mixture extracted with ethyl acetate. The organic layers were dried over MgSO₄ and concentrated. The resulting oil was purified on a silica gel column eluted with 3:7 ethyl:hexanes to yield the morpholine (3.0 g, 64%). The morpholine (3.0 g. 12.75 mmol) was dissolved in 50 mL MeOH 30 and 10% Pd/C (10 mg) was added. The mixture was stirred at ambient temperature under a H₂ atmosphere for 16 hours. The mixture was then filtered through celite and concentrated. The resulting oil was dissolved in CH₂Cl₂ (25 mL) and di-*t*-butyldicarbonate (2.8 g, 12.75 mmol) was added. After stirring for 4 hours, the mixture was concentrated and taken up in CH₂Cl₂ and washed with water, saturated NaHCO₃, and brine. The organic layer was dried over MgSO₄ and

concentrated to yield 2.8 g (89%) of the ester. The ester was dissolved in MeOH (30 mL) and NaOH (1.4 g, 35 mmol) was added. After stirring for 4 hours at reflux, the solution was concentrated, acidified with 1 N HCl and extracted with CH₂Cl₂. The organic layer was dried (MgSO₄) and concentrated to yield 4-Boc-morpholine-3-carboxylic acid as a white solid (2.4 g, 5 90 %). ¹H NMR (CDCl₃) δ 1.40 (m, 9H), 3.20-3.50 (m, 2H), 3.70 (m, 2H), 3.90 (m, 1H), 4.30-4.65 (m, 2H).

and di-*t*-butyldicarbonate (19.6 g, 90 mmol) and LiOH were added. After stirring for 12 hours,

5 the solvent was removed *in vacuo* and the pH was adjusted to 3 with KHSO₄ and extracted with ethyl acetate. The organic layer was separated, washed with brine, dried (MgSO₄), and the solvent was removed *in vacuo* to give 20.3 g (86%) 4-Boc-thiomorpholine-3-acetic acid: ¹H NMR (CDCl₃) δ 1.45 (m, 9H), 2.45 (m, 1H), 2.51 (m, 1H), 2.68 (m, 1H), 2.82 (m, 1H), 3.05 (m, 4H), 4.24 (s, 1H), 4.93 (s, 1H).

10 4-Boc-thiomorpholine-2-acetic acid can also be substituted for the compound of formula (XXIV) in Reaction Scheme 7 and can be prepared in the following manner: To THF (100 mL) was added diethyl fumarate (3.27 mL, 820 mmol), DBU (7.22 mL, 50 mmol), and aminoethanethiol hydrochloride (2.26 g, 20 mmol). After refluxing for 16 hours, the reaction was poured into saturated NaHCO₃, and extracted with ethyl acetate. The organic layer was

15 washed with brine, dried (MgSO₄), and the solvent was removed *in vacuo*. Chromatography (ethyl acetate) gave thiomorpholinone (2.61 g, 70%). The ester was dissolved in THF (50 mL) and borane/DMS (3 mL, 30 mmol) was added. After stirring for 16 hours, ethanol was added to quench the reaction. HCl gas was bubbled into the reaction and the mixture was refluxed for 2 hours. The solvent was removed *in vacuo* and the residue was suspended in 0.5 M NaOH

20 and CH₂Cl₂. The organic layer was separated, dried (Na₂SO₄), and the solvent was removed *in vacuo*. Chromatography on silica (MeOH/ethyl acetate) afforded starting material (0.71 g, 29%) and the thiomorpholine (1.26 g, 56%). The ester (3.0 g, 11.4 mmol) was dissolved in dioxane/water (1/1) and di-*t*-butyldicarbonate (2.29 g, 10.5 mmol) and LiOH were added. After stirring for 12 hours, the solvent was removed *in vacuo* and the pH was adjusted to 3 with

25 KHSO₄ and partitioned with ethyl acetate. The organic layer was separated, washed with brine, dried (MgSO₄), and the solvent was removed *in vacuo* to give 2.20 g (81%) 4-Boc-thiomorpholine-2-acetic acid: ¹H NMR (CDCl₃) δ 1.44 (m, 9H), 2.59 (m, 4H), 3.17 (m, 1H), 3.2-4.0 (m, 4H).

Reaction Scheme 7 depicts a synthesis in which a preformed, protected compound of formula (XXI) is coupled to the resin and deprotected to allow reaction with the protected compound of formula (XXIV). It will be apparent to the artisan that the sequence of this reaction series could be altered to provide the same deprotected piperonylamino-methyl benzoyl resin. An example of such a sequence follows. This example also illustrates how one would reverse the substitution pattern in the piperazineacetic acid ring.

4-Bromomethyl-3-nitrobenzoic acid (819 mg, 3.15 mmol) and HOBt (426 mg, 3.15 mmol) were taken up in 15 mL of DMF, DIC (795 mg, 6.30 mmol) was added and the contents were stirred for 30 min at ambient temperature. The mixture was then added to the resin and shaken overnight. The resin was filtered, washed and dried as before. The resin
5 showed negative ninhydrin stain. The resin was taken in 15 mL of THF containing piperonyl amine (1.51 g, 10 mmol), and shaken over the weekend. The resin was filtered, washed and dried (1.507 g). *N*¹-Fmoc-*N*⁴-Boc-piperazine-2-acetic acid (978 mg, 2.1 mmol), HATU (798 mg, 2.1 mmol) and DIEA (542 mg, 4.2 mmol) were mixed in 15 mL of DMF; and then added to the resin. After shaking for 24 hours, the resin was filtered, washed and dried as usual; the resin
10 weighed 1.693 g. The resin was taken in 15 mL of 30% v/v piperidine in DMF, and shaken for 2 hours to cleave the Fmoc protecting group. After filtration, the resin was subjected to the usual wash and dry cycle; the resin weighed 1.588 g. The resin, acetic anhydride (591 mg, 5.8 mmol) and DIEA (748 mg, 5.8 mmol) were taken in 15 mL of methylene chloride and shaken overnight to acetylate at *N*¹. After filtration, the resin was washed with methylene
15 chloride and dried in a vacuum desiccator for 5 hours. The resin was shaken with 15 mL of TFA:methylene chloride for 1 hour to cleave the tBoc protecting group at *N*⁴. After filtration, the resin was washed with methylene chloride (5x15 mL), followed by 20% triethyl amine in methylene chloride (5x15 mL) and then again with methylene chloride (5x15 mL). After drying, the resin weighed 1.294 g. 669 Mg of the resin from the previous step, DIEA (116 mg.,
20 0.9 mmol) and 4-chloro-2-(1-imidazolyl)-6-isopropylpyrimidine (200 mg, 0.9 mmol) were taken up in 6 mL of DMF and heated to 80°C for 24 hours. After filtration the resin was washed (DMF, methanol and methylene chloride) and dried. A portion (377 mg) of the resin from the previous step was suspended in methanol and photolyzed at 50°C for 6 hours. The solution was filtered, the solvent was removed and the residue was purified by chromatography (silica,
25 methylene chloride:methanol, 95.5), yield 14 mg. ¹H NMR and MS were consistent with the proposed structure.

The following compounds, shown in Table 1 through Table 7 are representative of the compounds of the inventions and were synthesized by the foregoing methods. All exhibited iNOS inhibitory activity at concentrations less than 25 μM.

INTERNATIONAL SEARCH REPORT

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claim(s) 59-64 is(are) directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.
